

One line

Open, fully on-device Android scam guardian for KZ/CIS — SMS, WhatsApp, Telegram. Private by design. RU / KK / EN.

PROBLEM & WHY NOW

Messaging fraud in Kazakhstan and the CIS is mass-scale: bank impersonation (Kaspi, Halyk...), OTP theft, fake police/courier scripts, remote-access scams. Global tools fail — cloud-first (privacy risk), English-centric, weak offline. AI made scams cheaper; victims still only have a mid-range Android phone.

Qorgau (protection) detects scam texts fully on-device. No INTERNET for analysis. Message text never leaves the phone. Built for the market English cloud tools skip — a direct take on Sentient Product Request #02: The Scam Guardian.

WHO IT HELPS

Everyday Android users in Kazakhstan, especially elders and less technical people. RU/KK speakers across CIS. Families who want protection without cloud spyware. One panicked SMS away from lost savings.

WHO IS BUILDING

I build this alone — Ayblek (@ayblekk), from Kazakhstan. Working Stage-1 MVP: Kotlin/Compose, pure rule engine, local history, RU/KK/EN UI, auditable JSON rules for real local scam patterns.

WHAT EXISTS NOW (STAGE 1)

- Notification capture: SMS · WhatsApp · Telegram (NotificationListenerService)
- On-device rule engine + auditable JSON pack (Kaspi/Halyk, OTP, AnyDesk, urgency+money...)
- Local alerts + history · settings · sensitivity · no cloud · no analytics on message content
- Stack: Kotlin, Jetpack Compose, Room · minSdk 29 · package kz.qorgau.scamguardian

WHAT'S OPEN — IF IT CLOSED TOMORROW

Open: full source + versioned JSON rule packs at github.com/ayblekk/Qorgau — anyone can audit, fork, and localize. If it dies: KZ/CIS users lose rare offline, in-language defense that never phones home. Only revocable cloud scanners remain — not trustworthy for every private message.

WHAT \$10K UNLOCKS (~3 MONTHS)

- 1 Public release**
License, docs, privacy policy, signed APK, install path users can follow
- 2 Rule corpus 2x**
More real KZ/CIS patterns + false-positive tuning on everyday messages
- 3 Low-end QA**
Test on 3–4 GB RAM phones — the hardware most people actually own
- 4 Contributors**
Demo video + guide so others can fork rules for new locales

PRODUCT SCREENSHOTS — STAGE 1 MVP

Live Android UI. Protection runs only on-device (badge: device-only). Per-app monitoring for SMS / WhatsApp / Telegram, RU·KK·EN language, sensitivity control, local analysis history — no cloud.

- Privacy badge on every screen: analysis never leaves the device.
Repo + source: github.com/ayblekk/Qorgau · Stage 1 rules engine, no cloud runtime
